## 1.0 INTRODUCTION

This manual outlines the Standard Operating Procedure (SOP) for processing Manual File Requests (MFR) using the updated KLAES File Tracking Web Portal and Mobile App. The update introduces a structured "File Quick Search" mechanism to accurately determine file locations and seamlessly route physical search requests to the Sorting, Collation, and Batching (SCB) Monitors.

## 2.0 UNDERSTANDING FILE LOCATIONS & RANGES

Before processing a request, officers must understand the three primary physical locations of files within the KLAES ecosystem:

### A. In-Transit:

Files currently moving between departments. The system will return the last office where the file was logged in.

### B. The Digital Archive (Registry 1 & 3):

Files successfully curated during the digitization exercise.

Registry 1: RES-1981 to 1991, COM-1981 to 2025, IND-1981 to 2025, AG-1981 to 2025, RES-RC-1981 to 1991, COM-RC-1981 to 2025, IND-RC-1981 to 2025, AG-RC-1981 to 2025.

Registry 3: CON-RES-1981 to 2024.

### C. The Pool Office (Registry 2 & 3):

Files currently held in the active processing pool.

Registry 2: RES-1992 to 2025.

Registry 3: CON-COM-1981 to 2025, CON-IND-1981 to 2025, CON-AG-1981 to 2025, CON-RES-2025, CON-RES-RC-1981 to 2025, CON-COM-RC-1981 to 2025, CON-IND-RC-1981 to 2025, CON-AG-RC-1981 to 2025.

## 3.0 STANDARD OPERATING PROCEDURE (WEB PORTAL)

### Step 1: Initiate Manual File Request (MFR)

Receive the physical request letter from the applicant/requester.

### Step 2: Execute "File Quick Search"

Key the File Number into the File Quick Search interface on the KLAES Web Portal. The system will categorize the file into one of the following statuses:

### Scenario A: File is "In-Transit"

- **Action:** The system displays the current location (last logged-in office).
- **Output:** Generate and print a Tracking Confirmation Slip for the requester to acknowledge the file's current location.

### Scenario B: File is in the "Archive" Range

- **Action:** The system confirms the file is in the Digital Archive.
- **Output:** Use the "Log a File" interface to log the file out to the requester. Generate and print the Tracking Sheet.

### Scenario C: File is in the "Pool Office" Range

- **Action:** The system indicates the file is in the Pool Office.
- **Output:** Generate and print a File Search Request (FSR). The system will automatically route this FSR to the designated SCB Monitor via the Mobile App.

### Scenario D: Pending Files (Unindexed within Range) (NEW)

- **Condition:** The "File Quick Search" identifies that the file falls within the Archive or Pool Office ranges but has **not yet been indexed** in the KLAES database. These are classified as **"Pending Files"**.
- **System Action:** The system automatically generates and routes a **"Blind Request"** directly to the SCB Monitor via the Mobile App.
- **SCB Monitor Action:** The Monitor conducts an immediate physical check to ascertain if the physical file is actually present on-site but was missed/out of range during the initial digitization.
- **Outcome 1 (File Found):** If the file is found, it is immediately treated (digitized/indexed) on the spot. Once indexed, the file is logged out to the requester via the "Log a File" interface, and the Tracking Sheet is generated and printed.
- **Outcome 2 (File Not Found):** If the file is not found during the physical check, it is officially flagged as a **"Missing File"**. The system generates and prints a **Missing File Confirmation Slip** for the requester to sign.

## 4.0 HANDLING "MISSING FILES" & 2ND CHECKS

If a file falls within the Archive or Pool Office ranges but is physically missing during the initial search, follow the protocol below:

For Archive Missing Files:

If the file is not found in the Archive, generate and print a Missing File Confirmation Slip for the requester to sign.

For Pool Office Missing Files (The 2nd Check Protocol):

1. If the file is not found in the Pool Office, the SCB Monitor must conduct a 2nd Check using the KLAES File Search (to verify if the file was part of the scanned/digitized batch).
2. If found in KLAES File Search: Initiate a 2nd Physical Search in the scanning outposts.
3. If NOT found in KLAES File Search: Generate and print a Missing File Confirmation Slip for the requester.

## 5.0 SCB MONITOR WORKFLOW (MOBILE APP)

The SCB Monitor plays a critical role in physical file retrieval and resolving unindexed files.

1. Real-Time Notifications: The SCB Monitor will receive instant push notifications on the KLAES File Tracking Mobile App for two types of requests:
  - File Search Requests (FSR): For indexed files in the Pool Office.
  - Blind Requests: For unindexed "Pending Files" within the Archive/Pool Office ranges.
2. Direct Physical Search: The notification will specify the exact location (Archive or Pool Office) and the File Number. The Monitor will direct the physical search team accordingly.
3. Handling Blind Requests (Pending Files):
  - Upon receiving a "Blind Request," the Monitor must physically locate the unindexed file.
  - If Found: Coordinate with the indexing team to immediately digitize/index the file, then update the app status to "Found & Indexed" so the Front Desk can log it out.
  - If Not Found: Update the app status to "Not Found - Missing," which triggers the Front Desk to print the Missing File Confirmation Slip.
4. Real-Time Feedback: The Monitor must update the status of the search directly on the Mobile App. This updates the Web Portal in real-time.

## 6.0 NOTE ON DIGITAL FILE REQUESTS (DFR)

The Digital File Request (DFR) workflow follows the exact same logic, routing, and location-checking protocols outlined above. The only difference is that the request is initiated digitally by the user, and

the system automates the generation of slips and routing to the SCB Monitor without manual data entry by the Front Desk.
